

Why FedAVOT stalls: transport is infeasible ($p_i > \pi_i$), so IPFP debiasing silently fails

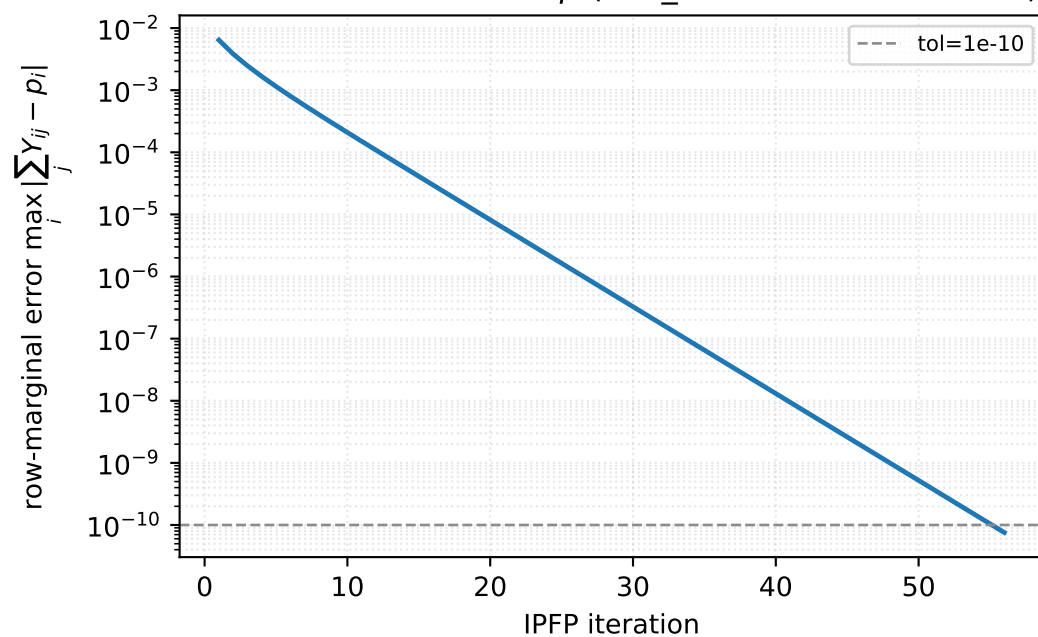

Feasible ($\alpha=0.2$): IPFP hits the target
0.0% of p -mass undelivered

Infeasible ($\alpha=3.0$): high- p clients pinned at ceiling
78% of p -mass undelivered $\Rightarrow$ loss floor

Feasible: IPFP matches p (row_err $\rightarrow 8e-11$ in 56 iters)

Infeasible: IPFP never matches p , stalls at $7.7e-02$ (max_iters=3000)
